

# Clinical Pharmacology & Toxicology Pearl of the Week

## ~Antihypertensives, Part 2: Cardio-selective Beta-blockers~

## **β-1 receptors:**

- ✓ Predominantly located on cardiac myocytes, kidney cells, and adipocytes
- ✓ Stimulated by adrenergic signaling molecules: (epinephrine/norepinephrine or dopamine)
- ✓ Adrenergic stimulation of G-PCR →↑cAMP→↑ phosphorylated calcium channels →↑ calcium release → sarcoplasmic reticulum release of calcium → muscle contraction/effector action
  - Cardiac myocytes: ↑ sinoatrial and AV node firing + ventricular muscle firing → increased contractility and heart rate
  - Kidney:  $\uparrow$  smooth muscle release of **renin**
  - $\circ$  Adipocytes:  $\uparrow$  lipolysis

## β-2 receptors:

- ✓ Found on smooth muscles (GI tract, bronchi, detrusor muscles, uterus, seminal tract), pancreas (For insulin and glucagon secretion), eye
- ✓ Stimulation leads to:
  - Smooth muscle relaxation
  - Increased ocular pressures (increased aqueous humour production)
- ✓ Less relevance in hypertension management

## **β-1 receptor antagonists:**

- Indications: Hypertension, coronary-artery disease, heart failure, arrhythmias, angina-pectoris
- o Examples:
  - **Cardio-selective (β-1 selective):** Atenolol, bisoprolol, esmolol, metoprolol
  - Non-selective: Nadolol, propranolol, timolol
  - Non-selective with alpha-1 antagonism: Carvedilol, labetalol
- **Anti-hypertensive mechanism of action**: Decreased renin (Decreased RAAS activity) and decreased inotropy and chronotropy.
- Anti-anginal mechanism of action: As above; mostly through negative chronotropy and inotropy (Lower O2 demand within myocardium)

#### Pharmacokinetics of cardio-selective β-blockers

	Absorption	Distribution	Metabolism	Elimination
Atenolol	50% T <sub>peak</sub> : 2-4hr	V <sub>d</sub> : 0.9-1.6L/Kg 6-16% protein bound	85-90% unaltered Small amounts of conjugation	85% renal ½ life: 6-7hrs
Bisoprolol	>80% T <sub>peak</sub> : 2-4hr	V <sub>d</sub> : 2.9L/Kg 30% protein bound	CYP 3A4 – inactive metabolites	98% renal 50% unaltered, 50% metabolites ½ life: 9-12hrs
Esmolol	IV only	V <sub>d</sub> : Unknown	RBC esterases	~80% renal (<2% unaltered) ½ life: 9 min
Metoprolol	~75% T <sub>peak</sub> : 1-2hr	V <sub>d</sub> : 4.2L/kg 11% protein bound	CYP 2D6 – inactive metabolites	>95% renal <5% unaltered ½ life: 3-7hrs

✓ Anti-hypertensive effect: <u>Flat response curve</u> (increasing the dose will change chronotropic response, but does not cause further reduction of blood pressure)

- ✓ Prescribing situations: Hypertension and...
  - Less than 60 years old (signal towards stroke in people on b-blockers over the age of 60)
  - Coronary artery disease (Within the last 18 months)
  - Heart failure
  - o Angina
  - Arrhythmia, including atrial fibrillation
- ✓ Combinations:
  - RAAS additive effect: β-blocker + ACEi/ARB, β-blocker + thiazide/thiazide-like diuretic
  - RAAS + vasodilation: β-blocker + CCB

#### Adverse effects/Toxicity:

- ✓ Side effects: bradycardia, hypotension, diarrhea, fatigue +/- depression
- ✓ Caution initiating/Escalating: Decompensated heart failure, pre-syncope, bradycardia
- Toxicity: bradycardia + hypotension, less β-1 selectivity in toxic ingestions leading to bronchospasm, hypoglycemia, altered mental status

The Clinical Pharmacology (CP) physician consultation service is available Mon-Fri, 8am-5pm. The on-call physician is listed in ROCA on the AHS Insite page. CP consultations are also available through Netcare e-referral and Specialist Link. You can also find us in the <u>Alberta</u> <u>Referral Directory</u> (ARD) by searching "Pharmacology" from the ARD home page. Click <u>HERE</u> for more details about the service.

The Poison and Drug Information Service (PADIS) is available 24/7 for questions related to poisonings. Please call 1-800-332-1414 (AB and NWT) or 1-866-454-1212 (SK). Information about our outpatient Medical Toxicology Clinic can be found in <u>Alberta Referral Directory</u> (ARD) by searching "Toxicology" from the ARD home page.

More CPT Pearls of the Week can be found <u>HERE</u>.
