

Study #: 20160730

Effective Date: 2/20/2024

Pathway to Prevention Study

A future without T1D starts with you. Get screened!

Family members of people with type 1 diabetes are at a 15x greater risk of developing T1D. With a simple blood test, TrialNet looks for diabetes-related markers that can predict your risk of developing T1D and determine if you are potentially eligible for a prevention trial.

Who can get screened?

- ▶ People between age 2 and 45 with a parent, brother, sister, or child with T1D
- ▶ People between age 2 and 20 with a grandparent, aunt/uncle, cousin, niece/nephew, or half-sibling with T1D

Pathway to Prevention Study

Know your risk of Type 1 diabetes

Why risk screening is important

We can now accurately predict your risk of T1D years before symptoms appear. Screening for the risk of developing T1D also provides an opportunity to participate in research that aims to prevent disease progression.

Participants who test positive for diabetes-related markers receive close monitoring. Their risk of being diagnosed in diabetic ketoacidosis (DKA) decreases from 30% to less than 4%.

Convenient screening options make it easy.

Take the first step today. Sign up to get screened!

In-Home Kit

Collect your own blood sample with a finger-prick and mail it back to us.

... or ...

Lab Test Kit

Take a kit with you to a local lab for a blood test.
