Essential Diagnoses/Syndromes

Diseases and syndromes within each of the relevant Internal Medicine Clinical Presentations have been divided into 'essential' and 'less important' entities.

At the end of the eight-week clerkship, it is expected that the clerk will be able to **diagnose** these 'essential' diseases and syndromes, and **to a lesser extent** treat them, as demonstrated by successful completion of the summative written examination and the in-training performance evaluation reports.

Conditions deemed 'essential' (**as summarized in Table 1**) have been categorized in this manner for a number of possible reasons, including:

- Common
- Acute presentations needing acute management
- Potential grave complications of missing diagnosis
- Important part of differential diagnosis for a given clinical presentation

For these reasons, 'essential' causes will make up most of the examination diagnoses. However, the final diagnosis on an examination question may be a 'secondary' cause, but the 'essential' cause(s) will feature highly in the differential diagnosis.

'Secondary' causes may be common diseases (ex: vasovagal syncope, chest wall pain) that may in fact be the final diagnosis on an examination question, but are listed as 'secondary' for reasons such as:

- Benign disease
- No specific treatment
- Diagnosis of exclusion (excluding the 'essential' causes)
- No specific diagnostic test for condition

Where a syndrome is listed (ex: hemolysis), the diagnosis of the syndrome is considered essential, and unless stated otherwise, the specific causes (ex: sickle cell) are less important.

Drug classes and their side-effects have been listed separately in section D, Table 2.

The numbers assigned to each clinical presentation correspond to their numbers in the main University of Calgary Medical School Clinical Presentation list.

Medical Charting

At the end of the eight-week clerkship, the clerk will be able to demonstrate accurate, complete, clear, and insightful medical records as shown by successful completion of the in-training performance evaluation reports.

The medical chart is a legal document and patient information must be kept confidential. It is important to complete all of your day's charting in a timely fashion (ideally before the end of the workday) as other team members are required to Attest/Sign your notes. With respect to electronic medical records, we expect clerks to write original notes rather than relying on "cut and paste" function.
